Who owns your identity layer?

It should be you.

Identities determine who can work, what they can access, and how quickly you can change direction. When one external platform owns that layer, it owns your policies, your identity data, and your options.

We help you get them back, without giving up the services you rely on.

Control. Your policies, your data, your decision on who gets in.

Resilience. Keep running, and adapt when requirements change

Sovereignty. Developed and supported in Europe.

Freedom of choice. On-premises, hybrid, or European cloud.

CVE Numbering Authority under the ENISA Root

Vulnerability information on our software, straight from the source, in the format your NIS2 and CRA reporting needs.

How fast could you move?

If your identity strategy had to change tomorrow, what would it take? Most organizations cannot answer that. We help you build the answer.

Own your digital identities

Identity and Access Management made easy

Access Management

One login. Everything you run.

Unify access across cloud, on-premises, and legacy environments without replacing what already works.

- Go passwordless with passkeys and certificates
- Tap a badge or key to log in to shared workstations
- Secure remote access with zero trust
- Secure on-premises Exchange and legacy apps with modern MFA
- Check every access attempt, from admins to end-users and externals

Every key, card, and certificate, managed in one place.

Identity Governance and Administration

Know who has access. And why.

Start fast, extend at your own pace, and stay audit-ready as you grow.

- Automate joiners, movers, and leavers from HR data
- Synchronize identity data across every connected system
- Govern your Microsoft and SAP landscapes from one place
- Build your own identity directory rather than renting one

Answer NIS2, DORA, and GDPR access questions the same day they are asked.

Secure Information Exchange

Send anything sensitive. To anyone.

Protect how you communicate outside your organization: files, messages, and meetings.

- Send encrypted files directly from Outlook or Notes
- Let external contacts send you files, no account needed
- Protect messages and files in Teams and Outlook
- Hold video meetings with verified participants
- Keep a full audit trail, recall files, and detect tampering

Verified identities on both ends, whether it is a file, a message, or a meeting.
