mic

The **Hygie Box Mic** is the most streamlined Hygie Box model designed for use with clumping plant-based litters. It significantly improves the daily routine of cat caregivers. Hygie Box Mic features a simple and fully functional design that ensures only waste containing urine and fecal moisture is discarded, while clean, dry litter remains in the box.

As part of the modular Hygie Box solution line, the Mic model delivers maximum efficiency for cat owners who choose corn and cassava plant-based litters, offering high performance with low environmental impact.

Core Concepts of the Hygie Box Line

• Intelligent and Modular Design

Hygie Box is not a conventional litter box. Its modular structure allows multiple configurations using the same components, adapting to different types of plant-based substrates.

• Static Safety

Unlike automated litter boxes, Hygie Box is a static system that requires no electricity, eliminating the risk of accidents and ensuring complete safety and well-being for cats.

• Environmental Commitment

All Hygie Box components are manufactured using a combination of high-quality virgin and recycled materials. The energy used in production comes from solar power. In addition, **ALL CATTUS PRODUCT** packaging is designed to minimize environmental impact.

Specific Advantages of Hygie Box Mic

The Mic model was specifically developed to optimize the use of clumping plant-based litters (corn and cassava) or mineral litters when mixed with high-performance biodegradable plant-based litters.

• Efficient Waste Separation

By pouring the tray's contents onto the specifically designed sieve, clumps, feces, and small waste fragments are retained.

• Significant Odor Reduction

By removing even the smallest waste particles that would normally pass through standard scoops, Hygie Box Mic eliminates the main sources of unpleasant odors.

• Substrate Savings

The technical design ensures that the maximum amount of clean litter returns to the tray. This significantly extends the lifespan of the substrate, generating savings that can reach up to 20%.

• Versatile Use

It can be used with **corn and cassava plant-based litters**, or with **mineral litters when mixed with high-performance biodegradable plant-based litter** to ensure proper clump formation.

• Operational Efficiency

Maintenance time with Hygie Box Mic is eight times shorter than with conventional litter boxes and scoops.

• Efficient Waste Disposal

The system separates clumps formed from urine and fecal moisture, keeping the litter area consistently clean and dry for cats. **CLUMPS MAY BE DISPOSED OF IN THE TOILET** (always consult your local sewage regulations).

Frequently Asked Questions (FAQ)

1. How does cleaning work with Hygie Box Mic?

At least once per day, pour the contents of the upper tray onto the sieve. Clumps and feces are retained for disposal, while clean litter falls back into the basin for reuse.

2. Can I use any type of litter?

The Mic model should be used with **clumping plant-based litters** or with **mineral litters mixed with high-performance clumping plant-based litter**. For wood pellets, we recommend the Hygie Box Kim model with high-performance clumping plant-based litter. For wood pellets, we recommend the Hygie Box Kim model.

3. Will my cat adapt quickly?

Yes. We recommend placing Hygie Box Mic next to the previous litter box and adding a small amount of used litter to the new box so the cat recognizes the scent. The open and comfortable design helps facilitate the transition.

4. Do I still need to use a scoop?

In Hygie Box Mic, the scoop is only used to remove small remaining residues, ensuring the litter stays clean and odor-free for a much longer time. Cattus has developed a **specialized scoop specifically for biodegradable plant-based litters**.

5. What is the ideal litter depth?

We recommend maintaining approximately **three fingers of litter depth (about 5-7 cm)** to ensure urine is absorbed before reaching the bottom of the tray.
