

BALLISTOL Training Spray – Train Realistically. Act Safely.

With its new Training Spray, BALLISTOL introduces an innovative and safe training tool specifically developed for practice and instructional use. The Training Spray enables users to realistically train with defense sprays without posing any health risks helping build confidence, safety, and routine for real-life situations.

The manufacturer deliberately refrains from using irritants, thereby offering a health-safe alternative to conventional defensive sprays. It realistically simulates the handling and spray characteristics of a live defensive spray, allowing movement sequences and target accuracy to be trained effectively. Both private individuals and security professionals can improve their responsiveness and safe handling of a defensive spray under controlled conditions and choose between two practical sizes. The 50 ml version features a flip-top safety cap with an integrated spring-loaded panic mechanism that enables quick and easy activation in an emergency. The 125 ml version is equipped with professional flip-top safety cap that provides an extra-wide grip area and a finger stop for particularly secure and precise handling, and can also be operated while wearing gloves. Both versions are identical in design and functionality to BALLISTOL's "real" defense spray counterparts, accurately reflecting realistic handling.

"Safe training is the key to acting correctly and confidently in an emergency," explains Andreas Zettler, Managing Director of BALLISTOL. "With our Training Spray, we offer a product that enables true-to-life practice scenarios without compromising the health of users."

For decades, BALLISTOL has stood for quality and trust in the firearms care and security industry. The new Training Spray complements the proven product range and supports users in preparing optimally for challenging situations.
