

Economical surface technology
Focus: Retrofit for blasting machines

At the EUROGUSS trade fair, which will take place in Nuremberg from 13 to 15 January 2026, Sinto AGTOS will be providing information about new trends in blasting technology.

The surface treatment of complex cast workpieces is becoming increasingly demanding. In this context, the reproducibility of the blasting process is also important.

Existing machines do not always deliver what is required today. Instead of a new investment, a retrofit may be a sensible option. Visitors will gain an overview of what needs to be taken into account and how the conversion can be successfully implemented in practice.

Proven solutions are also available for new investments. Individual design features can be optimally taken into account.

The Sinto AGTOS team looks forward to welcoming many visitors in Hall 5, Stand No. 5-149.
