

MICROBUILD®

A functional prebiotic solution to support gut health, digestibility, and immune development

Benefits of Microbuild

Promotes good intestinal health

Contributes to a diverse microbiome

Stimulates production of SCFA

Contributes to a healthy immune system

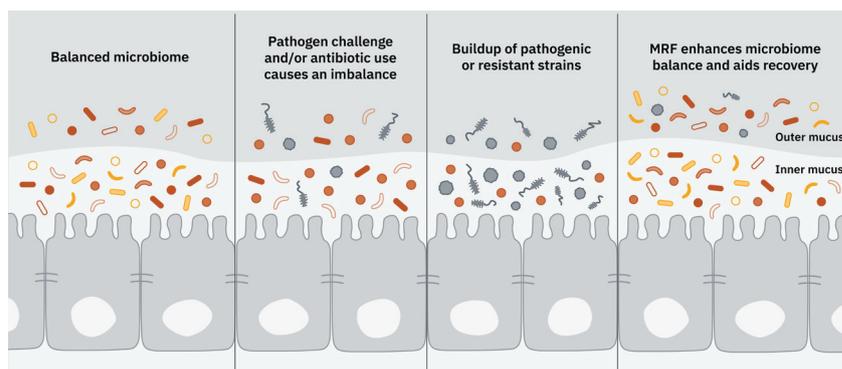

An effective gut health solution for dogs and cats

Microbuild® is an advanced prebiotic fibre derived from a mannan rich fraction (MRF) of *Saccharomyces cerevisiae*, developed specifically for use in companion animal nutrition. Built on nutrigenomic research and part of Alltech's second-generation yeast technology, Microbuild supports gut health, digestive efficiency, and immune function.

Microbuild promotes the production of short-chain fatty acids — key compounds that nourish the gut lining, balance the microbiota, and support overall gastrointestinal resilience. It also contributes to improved stool quality and nutrient absorption.

Backed by science, built for wellness

Microbuild is part of Alltech's second-generation yeast technology portfolio — enriched bioactives supported by peer-reviewed science and regulatory-compliant claims. It integrates easily into both dry and wet formulations and is well-suited for brands seeking to differentiate through functional health benefits.

Microbuild supports companion animal health and supports substantiated claims including:

- Contributing to good gut health
- Supporting immune system development
- Promoting the production of short-chain fatty acids
- Aiding in the normalisation of intestinal microflora
- Improving stool consistency
- Helping reduce the incidence of *E. coli* in the gut
