

Managed IT Security

We offer you a comprehensive security concept that reliably defends against modern threats and continuously protects your IT infrastructure. Traditional measures such as firewalls or antivirus software are no longer sufficient today – that's why we proactively monitor, analyze, and optimize your systems, tailored to your individual requirements.

Comprehensive protection for your IT

With Managed IT Security, you can combine SOC monitoring, proactive security measures, and ISO-compliant consulting in a holistic approach. This allows you to protect sensitive data, secure business processes, and relieve the burden on your internal resources.

Security Operations Center | SOC

Our Security Operation Center monitors your IT systems in real time—from servers, endpoints, and networks to cloud applications. Threats are detected, assessed, and prioritized early on, allowing you to respond quickly and effectively.

Information security is a key success factor

We accompany you every step of the way to ISO/IEC 27001 certification:

- **Workshops:** Clarify basics, roles, and responsibilities, create a roadmap to certification
- **Assessments:** Check current security status, identify gaps, and develop a prioritized action plan
- **Audits:** Identify potential for optimization and provide clear recommendations for action
