

# METALWORKING

We produce large and large-series of products as smaller quantities also. We offer consulting, making of 3D models, making a CNC program, basic or rough processing and finishing of your product. With the technologies we control and with the planning of the technological process of CNC machining, we determine the order of product processing operations and the appropriate tools. We have hardware for products of various dimensions. We are fast and offer short delivery times.

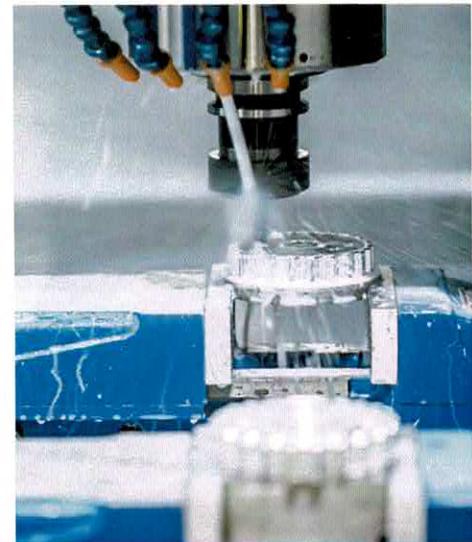

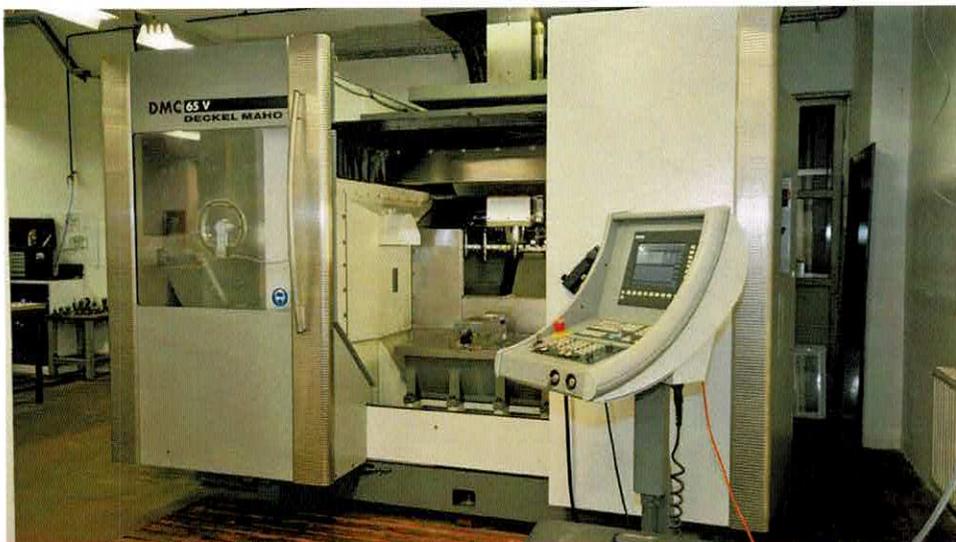

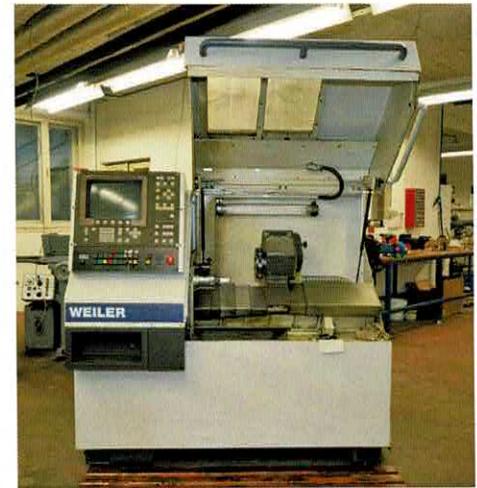

Milling

Turning

Grinding

Die sinking and wire erosion

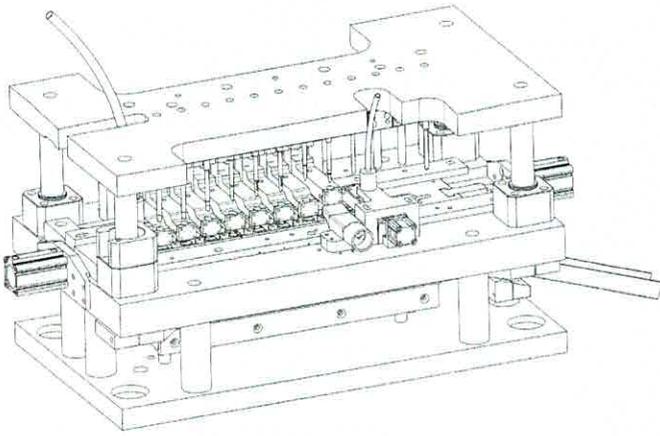

Sheet metal bending

# DESIGNING

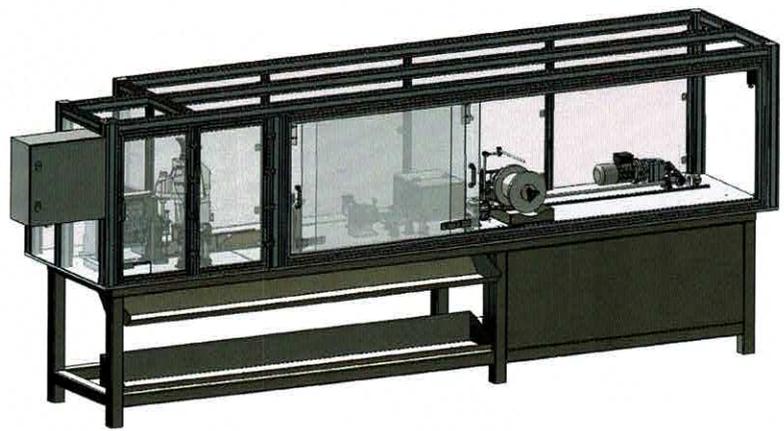

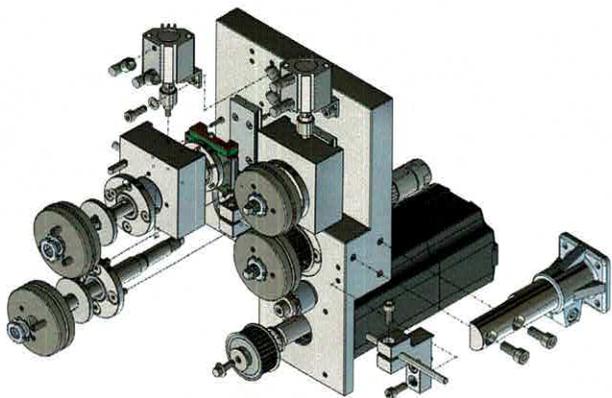

For technological needs in industry, we construct, model and design new dedicated machines and devices, prototypes, new lines and various mechanical and electrical installations. Depending on the requirements of the client, we can perform machine studies and upgrade existing hardware. We carry out projects for domestic and foreign clients.

We also perform a design service for those clients who do not manage to provide sufficient own capacities in the field of machine and device designing in a certain time.

The design of machines and devices involves the design of more or less large-scale systems and machines for workshops and industry. We start designing with consulting and composing a project task, which is a set of wishes, possibilities and requirements of the investor. If we also act as manufacturers or suppliers of designed equipment, we also take over the engineering package with comprehensive project management, until the final assembly of machines and equipment.

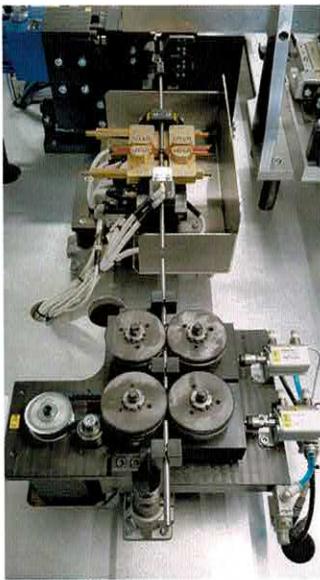

# MECHANICAL ENGINEERING and AUTOMATION

## Manufacture of machines and devices

Through comprehensive projects in mechanical engineering and the production of machinery and equipment, we increase the efficiency of the production process for our clients. We are implementing packaging lines, elevators and other equipment into the production process. With new machines and equipment, we upgrade the operations performed by the machines and improve the production.

Production of various panels

Production of packaging lines

Manufacture of robotic grippers

# MECHANICAL ENGINEERING and AUTOMATION

Our solutions in mechanical engineering are intended for:

- improving production productivity,
- improving production flow and linking processes,
- introduction of new equipment and development achievements in the field of production,
- optimization of work processes,
- minimizing bottlenecks and unnecessary operations in production,
- automation of assembly processes,
- automation of packaging processes,
- establishing processes related to new products in production,
- reduction of waste,
- lower energy consumption,
- improving spatial use,
- introduction and commissioning of new equipment and machinery,
- shortening production cycle times,
- computer aided production.

## Feeding systems

Rotary and line vibrators

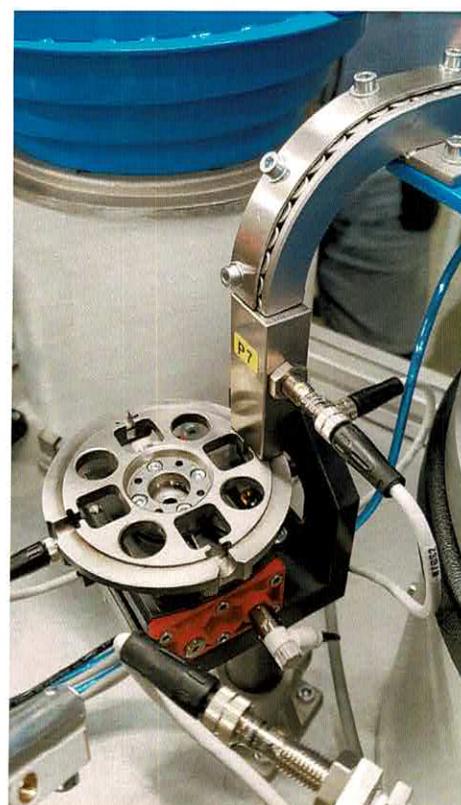

Lamellar feeders

Dividing units

## Feeding conveyors

Transport conveyors

Elevators

The mechanical engineering project begins with the initial identification of possibilities, including the perception of opportunities for the introduction of equipment or automation into the production process. In addition to consulting project comprising a total of planning, followed by comprehensive technical implementation, production and installation of equipment and final implementation of the process. We provide regular long-term maintenance and service activities.
