

Thermostatic expansion valves have always been the core components of refrigeration systems. Our R&D department has been committed to upgrading thermal expansion valves for many years, and has established a company in Tianjin dedicated to the R&D and production of thermostatic expansion valves, which has achieved gratifying results. Hongsen thermal expansion valve has been verified for more than 10 years and is comparable to world's most famous brands in terms of service life, reaction, stability, cooling capacity control, etc.

Hongsen seriously understand that solenoid valve is used in suction line, liquid or hot air line in order to protect different refrigeration systems. All functional tests are carried out to ensure the stable performance and service life of the solenoid valve. Besides, all our solenoid valves are 100% tested under helium detector.

"Escort for safe refrigeration" is not only a sentence, it also directs us to improve and develop refrigeration products.
