WHERE IT MEETS SECURITY

Devolutions
PAM

Privileged access manager built for IT professionals

Control, monitor, and secure elevated access and permissions for users, accounts, processes, and systems across your organization, while supporting governance standards and compliance requirements. Shrink the size of your organization's attack surface and reduce the likelihood and severity of breaches caused by hackers, or due to insider misuse and negligence.

Privileged account discovery

Automatically scan to discover privileged accounts (user, system, admin, service, database, etc.) from your provider(s).

Administrative reports

Keep track of privileged sessions and account activity with detailed admin reports for logging, audit, and compliance purposes.

Privileged session recording

Use the built-in recording server to save remote session recordings locally or remotely.

Secure credential injection

Securely inject credentials directly into remote sessions, but without ever exposing them to the user.

Automatic and scheduled password rotation

Enforce password rotation upon check-in of a privileged account, or schedule password rotations. This changes both the credentials for the system and stored in Devolutions Server or Hub.

Checkout request approval

Users can easily ask admins to checkout privileged accounts. Admins are automatically notified and can grant/reject the request as appropriate.
