

Password management your team will love to use

Proton Pass simplifies account security, access management, and secure sharing

Password managers are only effective when they get adopted. If they're too complex to use, teams stop using them, leaving gaps wide open for breaches to happen.

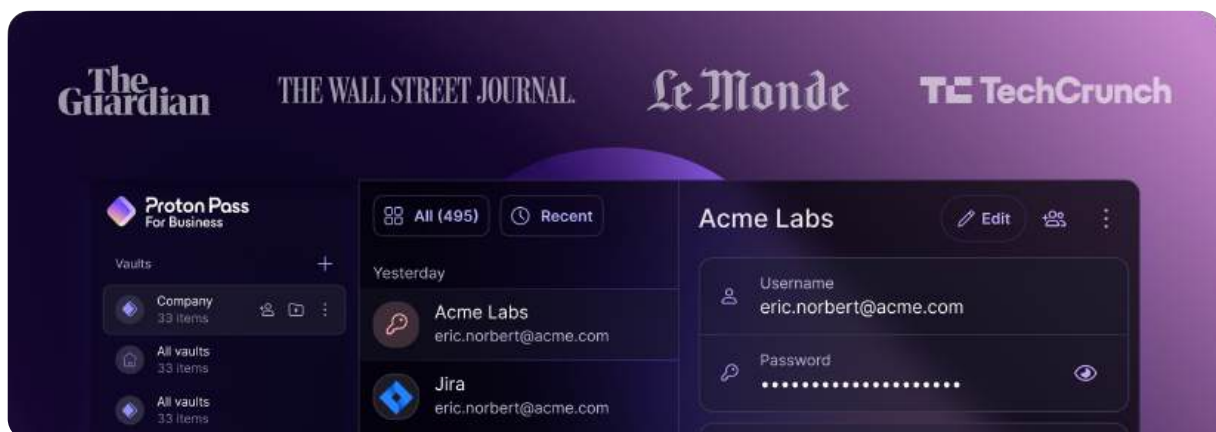

Proton Pass delivers credential security without the operational overhead, built with an intuitive design, end-to-end encryption, and Swiss privacy protections. So you can strengthen security, meet compliance requirements, and protect client trust.

47%

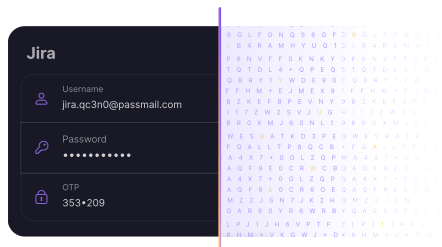

of SMBs have experienced a cybersecurity incident caused by human error

Proton Pass is ideal for:

- **Agencies and consultancies:** Securely share client accounts and manage contractor access.
- **Legal teams:** Protect sensitive systems and confidential credentials.
- **IT and security teams:** Enforce 2FA, password policies, and manage access across teams and projects.
- **Finance and compliance teams:** Support GDPR and PCI compliance with centralized controls.
- **Remote and hybrid teams:** Give distributed teams secure access to shared credentials from anywhere.

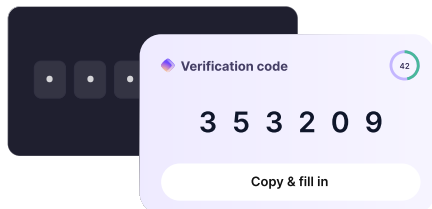

Key benefits

Secure access made easy for everyone

Most credential breaches happen because employees work around complicated security tools. Proton Pass combines secure sharing, autofill, built-in 2FA, and intuitive password management in one experience teams adopt naturally from day one.

Enterprise-grade access management without the overhead

Many password managers are so complex, they require a dedicated security team. Proton Pass gives organizations centralized admin controls, SCIM provisioning, SSO integration, and group-based access management without the deployment complexity or operational burden.

Centralized control and visibility

Manage users and groups, monitor weak and compromised credentials, and access audit logs from one centralized dashboard. Pass Monitor and Dark Web Monitoring help teams detect risks before they become incidents.

Built for trust

Open source and end-to-end encrypted, Proton Pass is compliant with GDPR, HIPAA, CJIS, and PCI regulations, is ISO 27001 certified and SOC 2 Type II audited. All your data is protected by Swiss law and accessible only to members of the team organization.

Key features

Enterprise policies

Proton Pass offers policies including password strength, data sharing and export, mandatory 2FA, and vault creation. Policies are customizable to help organizations fit Proton Pass into their everyday workflows.

Detailed activity logs

Admins can gain total visibility over actions being taken in their business network easily. Whether they're checking the permissions of an individual team member or the password health of the company, they don't have to leave Proton Pass to make adjustments to their password and data sharing policies.

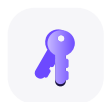

Browser, mobile and desktop apps

Proton Pass is available wherever team members need it, making remote and cross-device work simple. Data is synced automatically across all devices and platforms for instant access.

Built-in 2FA authenticator

Team members can store and autofill 2FA codes for any account directly in Proton Pass, eliminating the need to switch between apps. Admins can monitor 2FA adoption across the team and get visibility into which accounts are missing it, helping close security gaps.

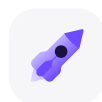

Built-in password generator

Anyone can generate strong, business-compliant passwords in just a few clicks. Admins can use the password generator team policy to set mandatory criteria for all new passwords, ensuring a base level of strength across the organization.

Secure sharing

Entire vaults or single items are easy to share, and access can be revoked whenever needed. Group-based access control lets you share with entire teams or departments at once, simplifying on-boarding and off-boarding while reducing the risks associated with manual credential sharing. For users outside your organization, secure links let you share individual items with anyone, no Proton Pass account needed.

Simple business access management

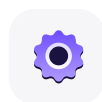

Integrate with SSO and SCIM providers to automate provisioning, streamline logins, and simplify access management across your organization. Group management gives IT teams centralized control while keeping access easy for employees.

Pass Monitor

Pass Monitor continuously helps organizations identify security risks across their credentials. It includes:

- Dark Web Monitoring that alerts you if email addresses or credentials appear in known breaches
- Password health alerts that flag weak, reused, or compromised passwords

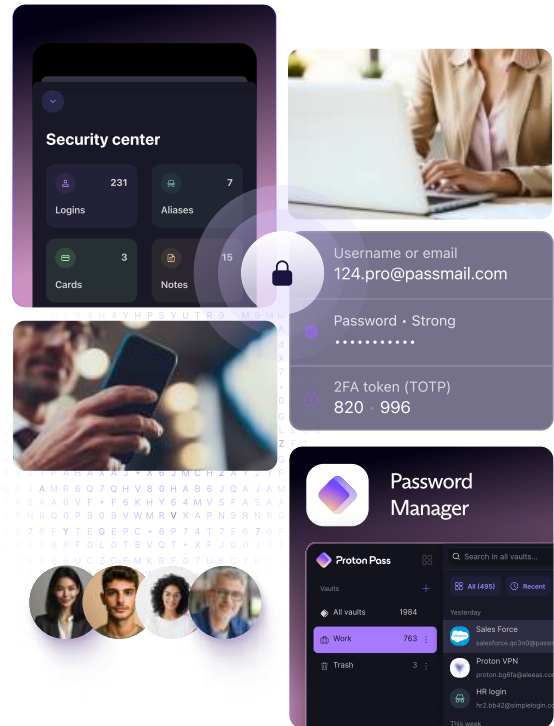

Central admin panel

Oversee and manage your team's accounts, users, policies, and credential security from one intuitive dashboard designed for small IT teams.
