

Vertical, digital, craftsman-friendly Experience Striebig's variety of saws live

Holz-Handwerk is a must-attend event, Striebig expects good discussions with tradespeople and specialised dealers. The focus of the presentation: the comprehensive range of saws suitable for the trade and a wide range of options for digitalisation. "We will be presenting saws and software in operation. Visitors can make live comparisons," says Daniel Bucher, CEO of Lucerne-based Striebig AG.

Vertical diversity saws digitally

Data transfer from the office to production is important for craft businesses. Striebig offers 7 different saw models and powerful solutions for digital support. OptiDivide makes it possible to digitally retrofit Striebig saws that are up to 20 years old.

CONTROL and STRIEBIG 4D can be equipped with BaseCut or ExpertCut ex works. BaseCut allows cutting optimisation via the touchscreen on the saw. ExpertCut imports data from CAD or ERP systems in the office. Cutting optimisation software processes the data, transfers it to the saw and guides you step by step through the panel cutting process. Common to both systems: the label printer on the saw.

Added value at no extra cost

"Our work is forward-looking. We are constantly improving the benefits of our technology. This is how we create added value for our users. We will be showcasing current examples at Holz-Handwerk," explains Bucher.
