Strengthen your malware defense

Secure your emails with malware protection against the increasing number and complexity of email attacks

Malware is a broad term that refers to malicious software designed to infiltrate and damage, disrupt, inspect a system or steal its data. It encompasses a vast number of criminal code types, such as viruses, ransomware, spyware, adware, worms, Trojans, bots, phishing attacks, etc. And most of them enter your organization through the main communication channel – email.

Every day, more and more sophisticated types of malware and other malicious attacks emerge to threaten your business. One accidental click on a dangerous and undesirable file attachments can lead to serious consequences, ranging from stolen business-critical data to major financial losses.

Your reliable protection against malware

The innovative solution of GBS, iQ.Suite, offers comprehensive and reliable protection against malware through:

- Four leading anti-malware scan engines
- Multi-layer security

- Fingerprint technology
- Security of attachments

Benefits

- Best-in-class protection against all types of malware, including targeted, custom-made malware, thanks to our multiple detection engines. Critical file attachments are removed and quarantined

- Real-time malware protection with powerful configuration flexibility that allows the creation of different policies based on internal rules and/or specific mailbox profiles

- Recursive (retroactive) or real-time virus scanning of all emails and file attachments, both event- and time-controlled

- URL inspection and protection from known malicious links

- Identification of file attachments via unique, tamper-proof file patterns (fingerprints) that allow you to enforce filtering and protection policies based on the actual file type of the attachments

- Additional Sandboxing capability to help address the grey-zone of malware and increase your protection against unknown threats (zero-day exploits) even further
