## Body Armor® Heel Reliever

### Heel Protector

The Body Armor® Heel Reliever offers effective pressure relief that can be used in preventive, acute or chronic phases of wound care, e.g. pressure ulcers. The special design allows for optimal positioning during VAC pump or compression therapy.

## WCS®

### Wound Care Shoe

The WCS® wound care shoe is a complete solution for immediate fitting. It can be individually customised for every patient in a very quick and easy process in order to provide carefully targeted pressure relief. Its design and the option of manually customising the four-layer insole enable precise pressure relief.

## WCS® Light

### Closed Wound Care Shoe

In the early stages of diabetic foot syndrome, patients need a comfortable, safe, pressure redistributing shoe that can be used both usable indoors and outdoors. It supports wound care, post-operative use, and diabetes management. The lightweight, breathable upper provides space for bandages, while the four-layer insole can be customised for plantar wounds. The Fully Rocker Sole with anti-slip profile ensures a stable, natural gait.

NEW

## Body Armor® Pro Term

### Foot stump orthosis

The quick solution for mobilisation after a forefoot amputation. The residual limb orthosis provides flexibility, stability and even compression during the interim period.

# AllRound Shoe®

## Closed Healing Shoe

The closed healing shoe is an “all-rounder” for postoperative or wound care. The wide opening allows easy entry into the shoe, making the circumference of the dressing irrelevant. The shoe has a seamless comfort zone and an exchangeable insole.

# Relief Dual®

## Off-loading Shoe

The flat sectoral off-loading shoe Relief Dual® is convincing due to the combination of a rubber outsole for grip and an EVA sole for optimal power absorption. In addition to the tried and tested DARCO quality features of square toe, low profile height and wide entry, the Relief Dual® scores with its soft liner and seamless forefoot area, which create a particularly comfortable wearing sensation.

# Relief Dual® Plus

## Off-Loading Shoe with High Ankle Support

The Relief Dual Plus® is a derivative of the Relief Dual® and has a 64 % higher shaft. It has additional application possibilities in postoperative care and can be used for wounds in the plantar forefoot area as well as dorsally at the heel.

# Commodus Open®

## Open Healing Shoe

The open design of the Commodus Open® makes it particularly suitable for care of postoperative wounds. The Commodus Open® serves to stabilise the foot, and provides shock and pressure redistribution after surgery or other wounds. In order to be able to relieve existing wounds in the forefoot area, the number of hook-and-loop straps to be used in the forefoot area can be freely selected as required. This shoe can be individually adapted to the needs of each patient.

# Sole Systems – Insoles

## PegAssist® Insole Peg Off-Loading Insole

- Relief Dual®
- Relief Dual® Plus
- Commodus Open®

This Insole is used postoperatively or for acute wound care and for targeted pressure relief. The individual pegs can be easily removed and allow selective work.

## PegContour® Insole Uni Universal Peg Arch Cushion Insole

- Relief Dual® (black)
- Relief Dual® Plus (black)
- Commodus OpenI® (grey)
- AllRound Shoe® (blue)

This insole is an effective, three-dimensional insole system with adapted heel contour and memory foam effect. This allows for optimal pressure redistribution. The pegs are individually removable, allowing individual adjustment and enable selective work. The symmetrically constructed insole can be worn universal right and left.

## Puzzle Insole® Modular Insole

- Relief Dual®
- Relief Dual® Plus

This Insole has been specially developed for fittings after forefoot and midfoot surgery. The two EVA foam soles differ in colour and Shore hardness. The three modules (small toe, big toe and middle module) can be individually exchanged and recombined for different indications.

## Relief Contour Insole Arch Cushion Insole

- Relief Dual®
- Relief Dual® Plus

This Insole conveys the feeling of a customised insole thanks to its anatomically adapted shape and enables almost full-area weight-bearing. The soft polyurethane (PU) material has high resilience and can be customised by grinding. The stretchable fabric provides a high wearing comfort.

## WCS® / WCS® Light Insoles Four-Layer-Insole-System

- WCS®
- WCS® Light

The design and the manually customising the Four-Layer-Insole-System enable precise plantar pressure relief. The four soles made of Plastazote®, EVA and insole foam differ in their Shore hardnesses and degrees of resilience.
