INKO)(naut is a registered trade mark of THEOcare Hygiene GmbH, Bergisch Gladbach. Might be subject to changes without notice.

Modern Incontinence Waste Management. Easy, Hygienic, Cost Saving.

Conventional storage, transportation and disposal of incontinence waste is inhygienic and certainly not a pleasant task. The waste must be sealed, usually externally in special containers and regularly disposed. During summer the smell can be very annoying for residents, staff and visitors as well.

The INKO(naut) incontinence vacuum system however, effectively isolates incontinence waste within the caring facility. Then storage and transport are safe and odour free.

Typically the cost of incontinence waste is extremely high as this waste is about 80% of total waste from a caring facility. The use of INKO(naut) incontinence vacuum system however leads to a significant reduction of the incontinence waste's volume and through this, a considerable saving of costs for waste disposal.

Unsealed and exposed incontinence waste is a constant danger to nursing staff through contamination by germs and drug resistant pathogens. Not only does it present a permanent hazard to the nursing staff, but it is also costly.

The unique INKO(naut) hygiene filter of the Inkonaut incontinence vacuum system effectively prevents the escape of pathogens and germs. The living and working environment remains unpolluted and clean, and most importantly the staff is protected

INKO(naut's Health Benefits At A Glance:

- + Significantly improves hygienic standards within the facility for patients, staff and visitors
- + Incontinence waste storage and handling without odour and risk of infection
- + High cost saving potential through a reduction of disposal and handling costs
- + Simplified storage and transportation of incontinence products
- + Minimizes the risk of infection by incontinence waste
- + Best service from a single source
- + Design fits standard waste collection trolleys
