

PRESS RELEASE

Becker-Antriebe GmbH
Friedrich-Ebert-Straße 2-4
35764 Sinn

A new dimension in comfort

Keep a close eye on your home with a central control unit

CentralControl CC41 – the central control unit for roller shutters and sun protection systems from Becker-Antriebe – is a universal control unit for all Becker systems. “We developed the CC41 in-house and precisely tailored it to our requirements. It can directly control all of the current wireless products in the Becker range using USB wireless sticks. This includes Centronic and B-Tronic products, as well as the new wireless generation CentronicPlus”, explains Maik Wiegmann, a Managing Director of Becker who is also responsible for the technical division.

Various different Becker products from all three wireless systems can be easily operated in parallel and automated with the CC41. The control unit is integrated into the network via LAN and Wi-Fi, while the latest updates can be conveniently downloaded via the Internet.

Clever features and an app make it easy to use

The CC41 control unit is designed for the smart organisation and operation of roller shutters and sun protection systems that have been automated with drives, sensors and external radio receivers. It is configured using the free Becker CentralControl app, which allows users to conveniently control the unit using a smartphone or tablet. The app can be used to program and control room scenarios and of course to organise individual receivers or also groups of products. For example, you can use the app to easily set timers so that roller shutters and sun protection systems are operated at defined times or based on the astronomy function – even when nobody is at home. You can set up and name different rooms and easily adjust the automatic settings for smart sun protection systems.

All of the data is stored locally on the central control unit. Users also have the option of accessing the system via a secure cloud connection. Furthermore, you can control the CC41 using your voice with Amazon Alexa.

Future viability through strong partnerships

homee makes it possible to use four standard wireless systems (WiFi, Z-Wave, Zigbee, EnOcean) and three proprietary wireless systems (Becker CentronicPlus, Hörmann BiSecure, Warema WMS) in one single app. Customers are thus able to individually combine the wireless standards they require using different cubes. “Naturally, we like to offer our customers complete solutions from our product range when they are installing new roller shutters and sun protection systems. However, the reality is that many customers are already using some smart devices in parts of their home. By integrating our products into homee, customers can enjoy the advantages offered by the CentronicPlus system for roller shutters and sun protection systems and also use other wireless ecosystems at the same time. homee is the ideal solution in these situations because it combines various different wireless worlds and applications within one app for the benefit of the user”, is how Frank Haubach, a Managing Director of Becker who is also responsible for the area of sales and marketing, summarises the benefits to customers.
