Tools for deep-drawing and ammunition production

Deep drawing is a kind of metal-processing widely applied in industry, especially in mass production.

Blanks of various shapes are processed in deep-drawing dies into products of different cross sections. The advantage of such machining is that finished components of improved mechanical properties are obtained, with minimum work and scrap rate.

There are two types of deep-drawing:

- Deep-drawing without any change in wall thickness.
- Deep-drawing with reduction of wall thickness.

At present, our production programme comprises tooling with round cross-section; working diameter up to 250 mm.

In this field of our production, we mostly manufacture deep-drawing dies for cartridge cases and other tools for ammunition production, i.e. for cases and bullets. These are tools for further finishing of cases and bullets (for necking, calibration and indenting of cases, deep-drawing dies for bullet jackets, dies for bullet pressing, etc.)

We manufacture all sorts of gauges for machine and manual inspection for ammunition production.

A part of our production programme comprises deep-drawing tools and tools for ammunition production.

Owing to our long-standing experience, we produce tools for a number of manufacturers of ammunition and tools for deep-drawing products.

We are available and willing to cooperate with all interested in this area, to the aim of exchanging experience and further improving the quality and performance of the tooling.

A part of our production programme is included in the catalogue, from which you can get an idea of our possibilities in the manufacture of deep-drawing tools and tools for ammunition production.

**COMPANY FOR PRODUCING AND SALE
OF HARD METAL TOOLS AND STEEL TOOLS**
