

Is your current MDM solution keeping you secure?

Tackle all your endpoint and server management challenges with a cloud-based solution that doesn't require enrollment

Quest

Many organizations have developed a mobile device management (MDM) plan as part of a unified endpoint management strategy. However, while effective for managing mobile devices, MDM solutions have their fair share of shortcomings when it comes to endpoint management and server management.

MDM solutions are primarily designed to manage devices like smartphones or tablets and do not provide comprehensive coverage for other types of endpoints, such as desktops, laptops, and servers. Tasks such as patching, device configuration, and performance monitoring are limited or unavailable, leading to gaps in endpoint management and leaving endpoints vulnerable to various threats. They also often operate as standalone platforms, focused solely on mobile device management. This lack of integration can result in fragmented management processes and increased administrative overhead, especially in modern IT environments with diverse device types and operating systems.

While MDM solutions are essential for mobile device management and security, they have limitations in terms of device coverage, granular control, and integration. KACE Cloud Companion Edition overcomes these limitations and complements enrollment-based solutions, like Microsoft Intune or VMWare Workspace One, allowing organizations to keep pace with high volumes of patches, manage different server environments, and deploy complicated software updates for mobile and Mac devices.

The importance of comprehensive endpoint and server management software

Endpoint devices are the primary targets of cyberthreats. According to Forrester Research, the number of ransomware attacks on enterprises is up 500 percent, costing businesses in excess of \$11.5 billion. By effectively managing endpoints, organizations can mitigate the risk of security incidents and avoid critical data loss or costly payouts.

Well-managed endpoints and servers also minimize disruptions to business operations through proper configuration and maintenance and allow users to access the resources they need to perform tasks effectively. As organizations grow and evolve, IT infrastructures can adapt to changing business requirements and support new technologies and initiatives.

Many industries are subject to compliance standards related to data protection and privacy. Comprehensive endpoint and server management strategies help ensure that organizations meet these requirements by implementing necessary security measures, monitoring activities and maintaining proper documentation.

What does no enrollment look like?

Traditional solutions often require devices to be registered with a central management system before they can be controlled. However, in solutions that don't require enrollment, the management capabilities are typically built into the device itself or are activated through lightweight agents that are installed on the devices. These agents enable IT administrators to remotely manage and monitor the devices without the need for users to take any additional action.

The absence of enrollment offers several benefits:

- 1. Ease of deployment** – Devices can be quickly onboarded without requiring users to go through complex setup processes.

2.Reduced user intervention – Users do not need to formally enroll their devices, which reduces the burden on them and minimizes the risk of errors or delays.

3. Increased flexibility – Devices can be managed regardless of their enrollment status, making it easier to support a diverse environment.

4. Improved security – The ability to manage devices without enrollment ensures that they can be monitored and secured, even if users are not actively participating in the management process.

A solution without an enrollment prerequisite offers a more flexible approach to endpoint and server management, providing coverage for devices that cannot be enrolled via MDM, such as Windows servers.
