

Security Analytics & Operations, Reimagined

Harness the power of your data to search, assess, detect, investigate, and respond across everything. Wherever it is. Whatever it is.

The SIEM Strategy Paradigm Shift: Security Analytics Mesh

Vega's Security Analytics Mesh (SAM) unlocks total flexibility to store and utilize data while keeping costs under control, increasing visibility, and closing detection gaps.

With zero migration or ingestion costs, SAM is a vendor-agnostic, AI-powered query engine that lets you search, investigate and analyze across multiple SIEMs, data lakes, XDR platforms, and whatever else you got using natural language or fully normalized KQL.

Enterprise SecOps teams can run analytics on affordable infrastructure at scale using SAM, without sacrificing on visibility or performance.

→ Access All Security Data, Wherever it is

Natively search, hunt & detect against every dataset and every data platform in your environment - across SIEMs, data lakes, cloud storage, and security platforms with zero migration or ingestion.

→ Continuously Assess Detection Posture

Continuously evaluate and automatically optimize Visibility, MITRE coverage, and Detection Efficiency, in real time.

→ Operationalize Threat Intel

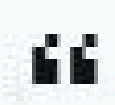

Transform raw threat intelligence into actionable detections, seamlessly deployed across your environment.

→ Extend a Cross-Platform Detection Program

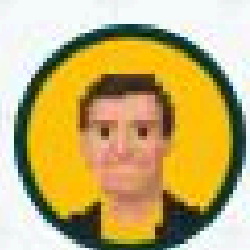

Create and deploy complex detection-as-code attack scenarios or adopt Vega's AI-Tuned detections that are MITRE-mapped and automatically tailored to your environment

→ Augment with AI for Fast Time-to-Value

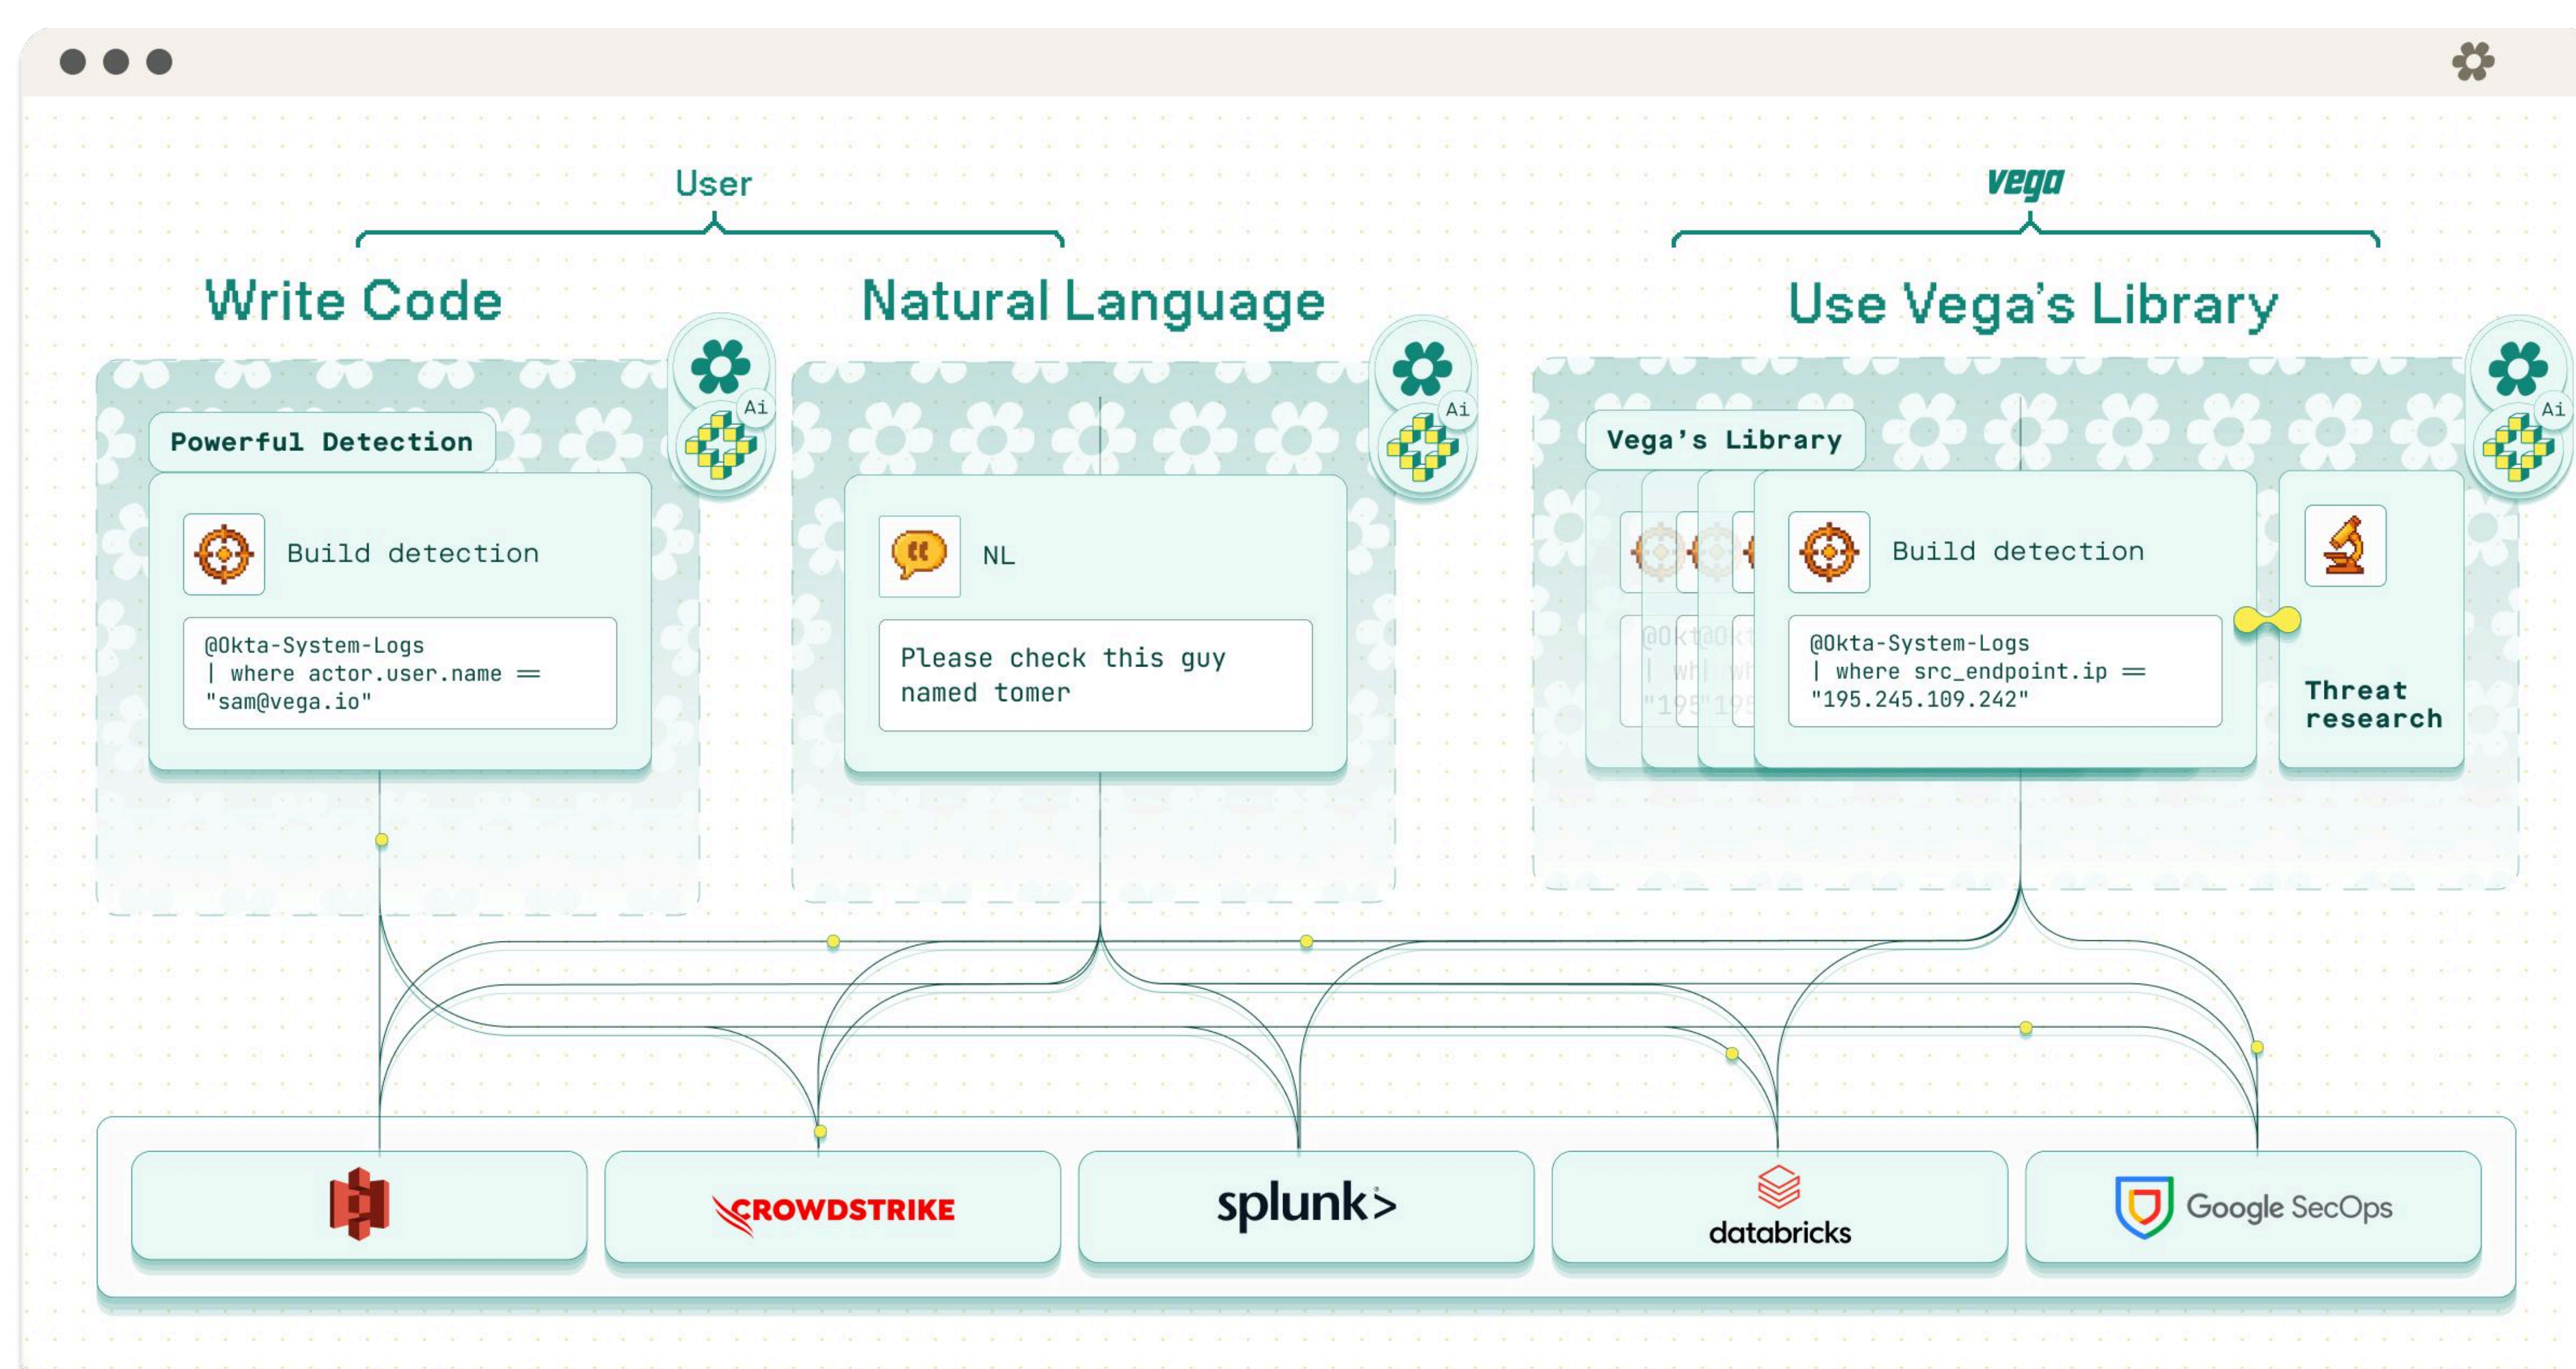

From access to detection to investigation, everything runs at the speed your business needs, not the pace of legacy tools. As your stack evolves, Vega's AI future-proofs your SOC.

Vega lets us run consistent detections across disparate datasets, drive down SIEM costs, and finally analyze critical logs we've always had to ignore
