

# masstick

FEED THE IMPOSSIBLE

- Masstick does not contain animal or vegetable compounds from land origin, or from freshwater, attractants, artificial preservatives or synthesis products.
- Masstick provides an essential source of proteins, lipids rich in fatty acids (EPA, ARA and DHA), vitamins and carbohydrates, all from natural sources of marine origin.
- Masstick formula naturally attracts finicky fish which begin eating it immediately or shortly after adding it to the aquarium.
- Masstick is mainly composed of freeze-dried zooplankton, it does not contain fish skeleton and is therefore very low in phosphates compared to its protein content.
- The rehydratable powder formulation allows Masstick to be blended with any mollusc or crustacean pulp as well as eggs from fish, molluscs and crustaceans, artemia, mysids, copepods, rotifers and medicines that are administered orally.

easy reefs®

**Masstick is a self-adhesive paste in the form of a dry powder, ready to use once it has been hydrated.**

Masstick is made with the freshest and highest quality ingredients. The blend consists mainly of shrimp (*Palaemonetes varians*) harvested in our Veta La Palma Natural Space which are immediately freeze-dried to maintain an optimum nutritional value. Freeze-dried microalgae and macroalgae is also added to the blend in order to satisfy the nutritional needs of a wide variety of marine fish.

The production process is controlled and supervised by our technical and scientific personnel to guarantee a final product with the highest quality.

## HOW TO USE Masstick

Add RO water to the Masstick bag in a ratio of 0.5 to 1. For a bag of 14g, add 7-8 ml of RO water. Knead inside the small ziplock bag until a homogeneous mixture is obtained.

Once the mixture is homogeneous, Masstick may be used immediately, be kept in the fridge for a couple of days, or frozen for up to 5 weeks without losing its nutritional values.

Take a portion of Masstick and stick it on a rock, a branched coral skeleton or preferably on the aquarium glass. Try to start with a small portion and increase it proportionally according to the needs and response of your systems.
