

THESE COCKTAILS WILL MAKE YOUR COMPANY SAFER.

Choose Your Security Mix

At it-sa, we don't serve a standard drink—we serve your personalized security cocktail:

You choose the topics that matter to you, and within just 15 minutes, we'll provide concrete recommendations for addressing your biggest security risks.

Digital Sovereignty

Growing dependencies on cloud providers, software solutions, and digital services can lead to vendor lock-in, high switching costs, and limited operational flexibility. We analyze your digital dependencies, assess risks, and show you concrete paths toward a secure, resilient, and autonomous IT infrastructure.

AI

AI is being used more and more—often without oversight or authorization. Shadow AI can lead to confidential data leaking outside the organization, creating data protection, compliance, and security risks. We provide transparency regarding your AI usage and develop a suitable security strategy. In doing so, we demonstrate how AI can be used securely and how sensitive information can be protected through appropriate measures.

Digital Identities

Inadequately managed access rights and compromised credentials create security vulnerabilities and enable unauthorized access to systems and sensitive data. We assess your identity and access landscape, identify vulnerabilities, and work with you to develop a secure, efficient, and future-proof solution—from clear permissions to modern authentication concepts.

ISMS

NIS2, the GDPR, and ISO/IEC 27001 place high demands on information security. However, organizations often lack the time, expertise, and resources to effectively implement these requirements in their day-to-day operations. We identify security gaps and translate requirements into concrete, practical measures. In doing so, we guide you through the process of certification or recertification—cost-effectively and with a clear goal: information security that works in everyday operations.
