

Our goal

We strive for a balanced ecosystem so that together we can ensure a healthier world for animals, nature and people. Together we bring your pet's microbiome back into balance - without antibiotics, instead sustainable.

The science behind Doderm Hydro Repair Gel

In and on our body there are many micro-organisms, such as bacteria, viruses and yeasts. Collectively, these microorganisms are called **the microbiome**. This is completely natural and good. When balanced, they protect our skin and keep it healthy. Staphylococci, or "ordinary" skin bacteria, can enter the skin when the skin's microbiome is

damaged. They weaken the skin: it becomes vulnerable to bacterial infections. The Staphylococcus toxins then cause skin inflammation. How can we keep the microbiome healthy when we look at nature? One phenomenon is the first milk of the calving cow. In the first week, it provides the calf with vital defense substances. This is important because the calf was not connected to the placenta during gestation. Its immune defense must therefore be built up immediately after birth with the mother's milk. Its first feed (colostrum) contains the corresponding amount of antibodies - like a mini-immune system that the cow passes on to the calf. After the calf has already received enough antibodies, we extract these antibodies from the milk. We have developed the special procedure for this over 10 years of research. Now we add these actively extracted antibodies from the milk to our Doderm Hydro RepairGel and supplement its range of action with other natural remedies. Together with other important ingredients, we can help the skin to fight the bacteria. We

nourish and support the skin's natural microbiome. As a result, the skin regains resistance. The "good" bacteria return and are nourished by our skin gel, while the "bad" ones disappear. The pH values of the skin are brought back into the right balance for dogs, cats and horses.

Ingredients

In addition to the IgG from cow's milk, we use other ingredients to soothe and restore the skin. We use honey to inhibit inflammation. In addition, we use Ceramide. These are building blocks to close the skin barrier. We use oats to counteract the itching. Ballonrebe and Calendula are vegetable substances and especially for wound healing and regeneration of the skin. We also use vitamins A + E + B for a good recovery of the skin.

Usage

Use Doderm Hydro RepairGel Horse or Pet for the treatment of wounds, mug, irritated spots due to summer eczema, etc. All Doderm products are Doping free.

Therapy

Wash the area to be treated with lukewarm water and a mild shampoo and then rinse the shampoo with enough lukewarm water until it is clear. Then dry the skin by dabbing with a clean towel. Then apply a thin layer of Doderm Hydro RepairGel to the irritated skin 2 to 3 times a day. First results become visible after 3 to 5 days. Then continue to lubricate until the skin has completely recovered (an average of 2 to 3 weeks).
