

WithSecure[™] Elements AI Security

AI Security starts with seeing

Know what AI is running in your business

Your people adopt AI tools faster than anyone can track them: browser extensions, personal chatbot accounts and AI agents with their own credentials. Data leaves through channels security never sees. Unmonitored AI use puts compliance and intellectual property at risk. Moreover, AI agents often carry more privilege than their creators.

WithSecure[™] Elements AI Security shows every AI tool, browser extension and AI agent active in your environment, approved or not. Get a clear view of how AI is used in your organization and a practical starting point for managing its risk. Everything is in the Elements Security Center, the console you use for your other WithSecure security capabilities.

See every AI asset. Control the risk.

Find shadow AI

The AI Security Dashboard and Software Inventory list every AI tool in use, including the ones nobody installed officially.

Catch risky browser extensions

See AI browser plug-ins on every managed device before a compromised one reaches your data and credentials.

Control AI use in the browser

Usage visibility and control, built on Browsing Protection, show how your people access AI through the browser and let you set limits.

Track AI identities

Through Microsoft Entra ID service principals, see AI agents, AI chat assistants, AI coding assistants, and other generative AI tools running with their own credentials, often with more access than the people who created them.

Prove AI is under control

Evidence for management and compliance, straight from the console, with no manual exports.

Nothing new to install

AI visibility is available as Early Access in the Elements Security Center, the same console you use for your other WithSecure Elements solutions.
